Iperia is the emerging leader in voice-oriented service creation platform technology, serving both service providers (wireline, wireless, and broadband) and enterprise companies worldwide. Iperia's enterprise platform IperiaVX allows the integration of new and existing applications into a voice-enabled framework. Iperia's ActivEdge software is based on open industry standards, such as SIP and VoiceXML, and leverages off-the-shelf hardware components. Iperia offers a suite of "best in class" applications plus an open architecture that provides interoperability with shared resources and systems. This combination provides a new level of efficiency and ease of use to personal and business communications. For more information, visit www.iperia.com

Solutions

Products Supported

SnowShore IP Media Server™

IperiaVX is the next generation of Iperia's ActivEdge Unified Communications (UC) product. Building upon the carrier class foundation of ActivEdge (AE), IperiaVX merges web based technologies as well as traditional back-office mission critical software applications with telecommunications functionality into a high performance, carrier grade voice processing platform. This convergence of technologies allows Iperia to quickly and easily provide seamless integration paths to voice enable and thereby expand the scope and usefulness of traditional non-media specific applications. By tightly coupling the two disparate technologies, the next generation IperiaVX platform allows both enterprise customers or service providers to build, customize and deploy more efficient tools and utilities to increase productivity.

Benefits

IperiaVX allows service providers to offer to their end users, enterprises or residential consumers, exciting new features. The functionality developed can increase ARPU, reduce churn and generate new customers. Service providers can also use these united technologies to create new or customize existing applications to better suit an industry vertical market. Enterprise customers can use IperiaVX to develop new functionality and enhance existing functionality to increase usability for their specific vertical application. They can also use IperiaVX to provide telephony interfaces into their mission critical applications to allow remote access to and from these applications
